

CURRENT MUSSEL AND CLAM BIOTOXIN DATA

The data below contain recent molluscan bi-valve shellfish (clams, oysters and mussels) biotoxin data. Paralytic Shellfish Toxin (PST) is measured in micrograms per 100 grams ($\mu\text{g}/100\text{ gm}$) of shellfish meats and Domoic Acid (DA) is measured in parts per million (ppm). A result of 80 for PST is the Closure Level. A result of 20 for DA is the Closure Level for molluscs, and 30 for crab viscera (guts). Results in **RED** are above the Closure Level for recreational and commercial shellfish harvesting. ODA and ODFW may jointly re-open recreational harvesting if two consecutive samples from the same species and from the same beaches, both have lab results below the Closure Limit. Please see the Biotoxin Map on our website for recreational shellfish closure areas.
